GARDEN BOUTIQUE

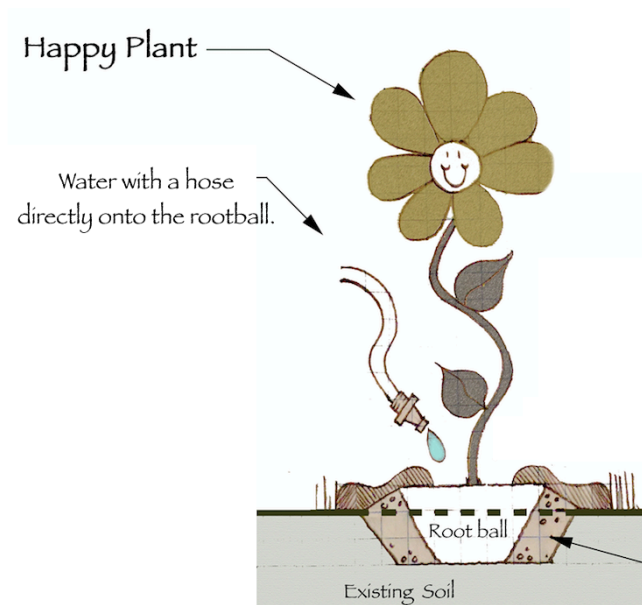

## Watering Guide

Our Watering Guide is based on Lowcountry temperature and whether you have well draining soil or poor draining soil.

If you live in North Mt. Pleasant (in Dunes West, Park West, Carolina Park, Planter's Point, or others), your soil tends to be poor draining clay soil. Your waterings will need to be thorough but not as frequent as if you have well-draining soil.

If you live in an area like the Old Village, Cooper Estates, Ion, West Ashley, or downtown Charleston, with well-draining topsoil, your plant will need, initially, a lot of water and frequently.

**We recommend thoroughly and individually watering your plants with a hose directly onto the rootball as shown in the image below. New plants need a lot of water from the hose onto the rootball. This is especially true during our hot summer months, and it is *critical* to their success.**

Please note: Automated irrigation systems generally do NOT put enough water at the root level and are best used after the first 6 months. Relying on such systems may void your warranty. Give us a call at 843-884-9738 or email us at [info@abideawhile.com](mailto:info@abideawhile.com) for guidance!
